Motivation

Motivation

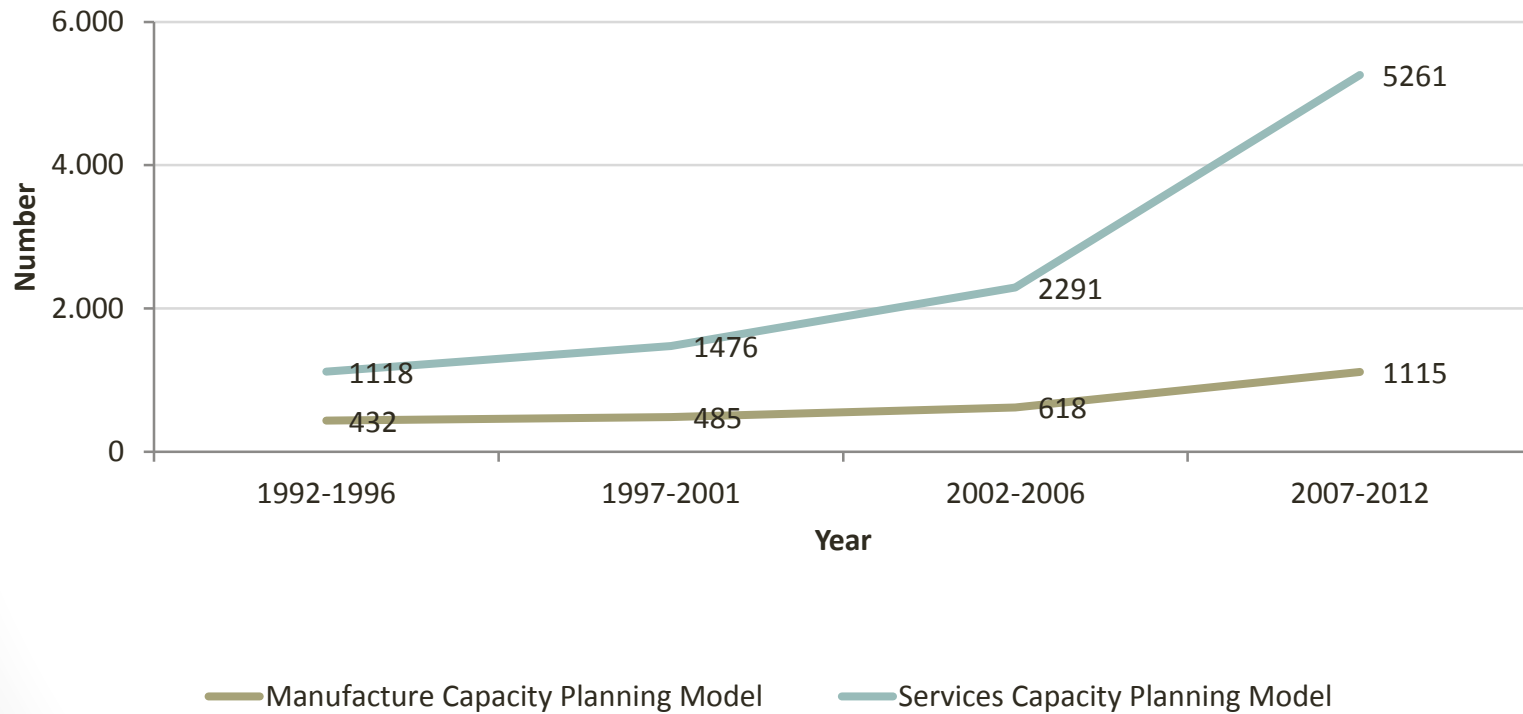

Service industry

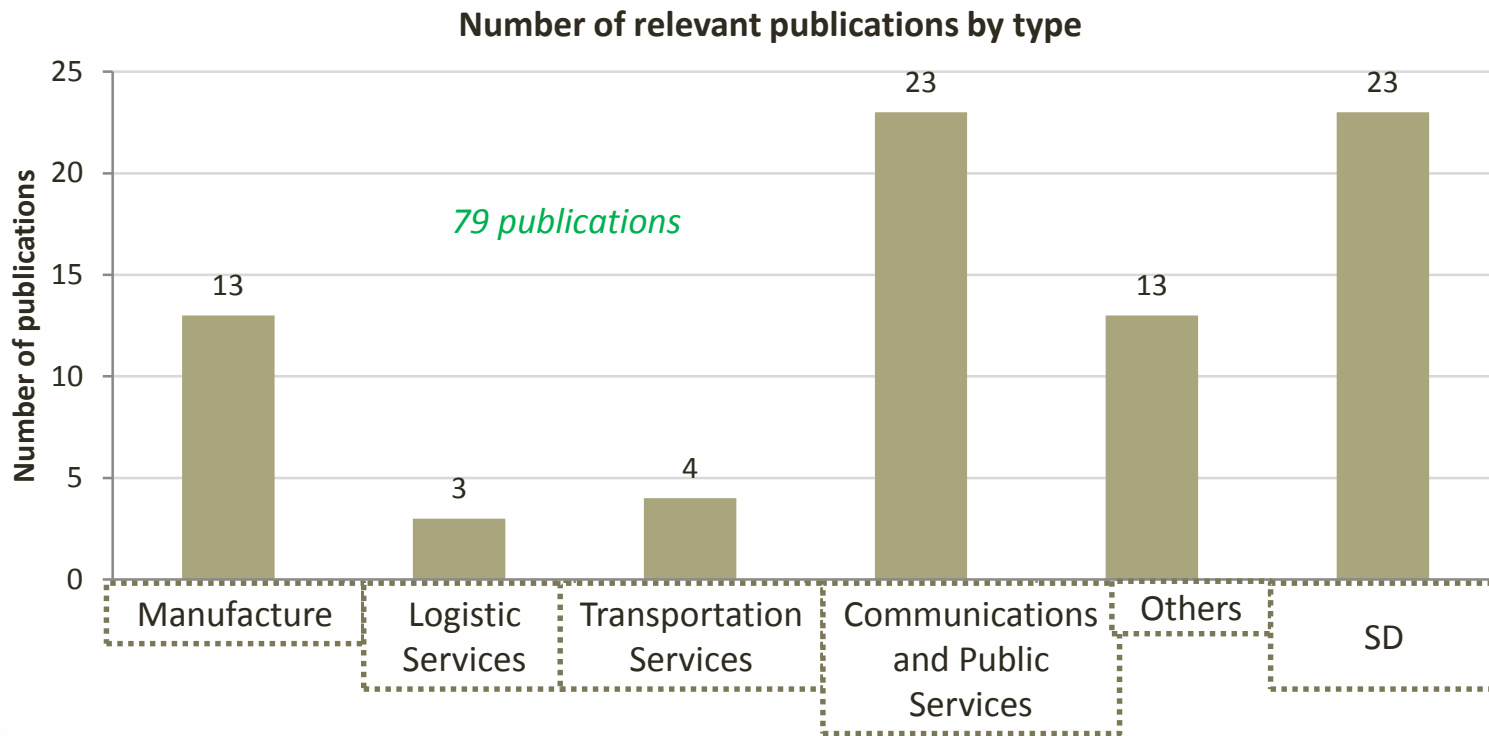

Source: World Trade Organization

- The financial sector in Colombian:
 - shows the highest growth in the GDP between the first quarter of 2012
 - comparing with the same quarter last year (**6.7%**) after mining sector (**12.4%**)
- In 2012 the Annual Survey of Services 2010:
 - which includes 5,343 companies, shows the total staff employed 346,371 people
 - *service companies* corresponds to **21.6%**, compared with **31.3%** manufacturing industry
- The Financial Superintendence of Colombia in the same year:
 - highest profit percentage (23.6%) recorded the credit institutions

Number of publications evolution (1992-2012)

Motivation

Publications

From the review it can be said that within the **capacity planning models** and even services that apply system dynamics,

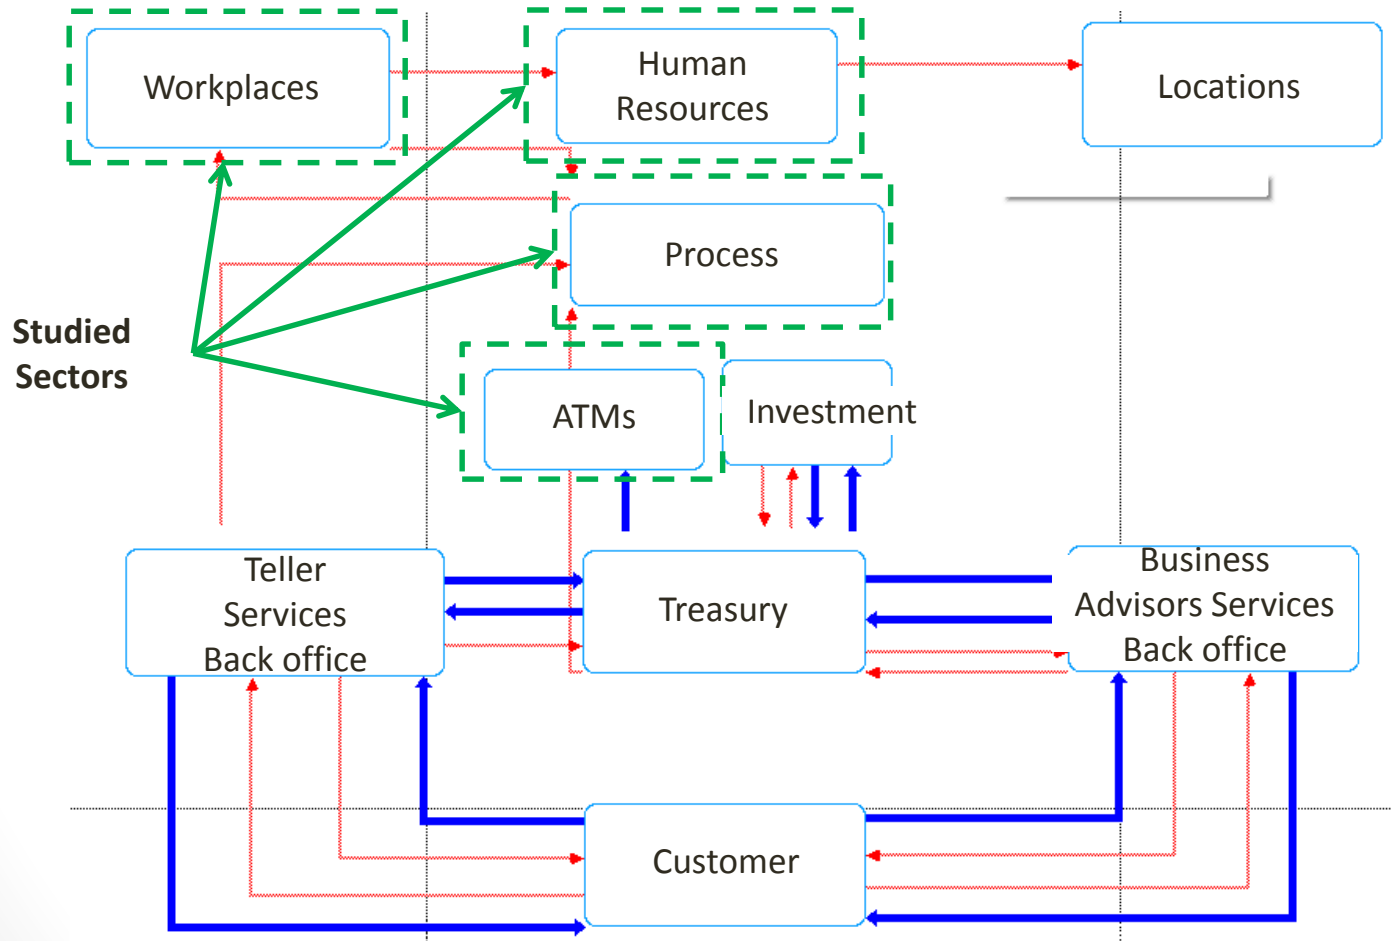

are **not considered fully the elements** included in the model result of this research,

specifically behavior analysis of **allocated workforce** and related **workstations** by operative processes and **work shift** in the fields of human resources, workstations and **electronic payments**.

Motivation

References

Comprehensive and dynamic model

Motivation

Problem

Establishing the importance of the **workforce allocation** study in the service industry,

specifically in credit institutions of the Colombian **financial sector**,

given its complexity and the dynamic relationship between the **operational capacity determination** in offices (workers and workstations),

with respect to **fluctuations in transactional demand** of system, which addressed the problem through system dynamics.

Hypothesis

Hypothesis

With the development of **capacity model using system dynamics** in this research,

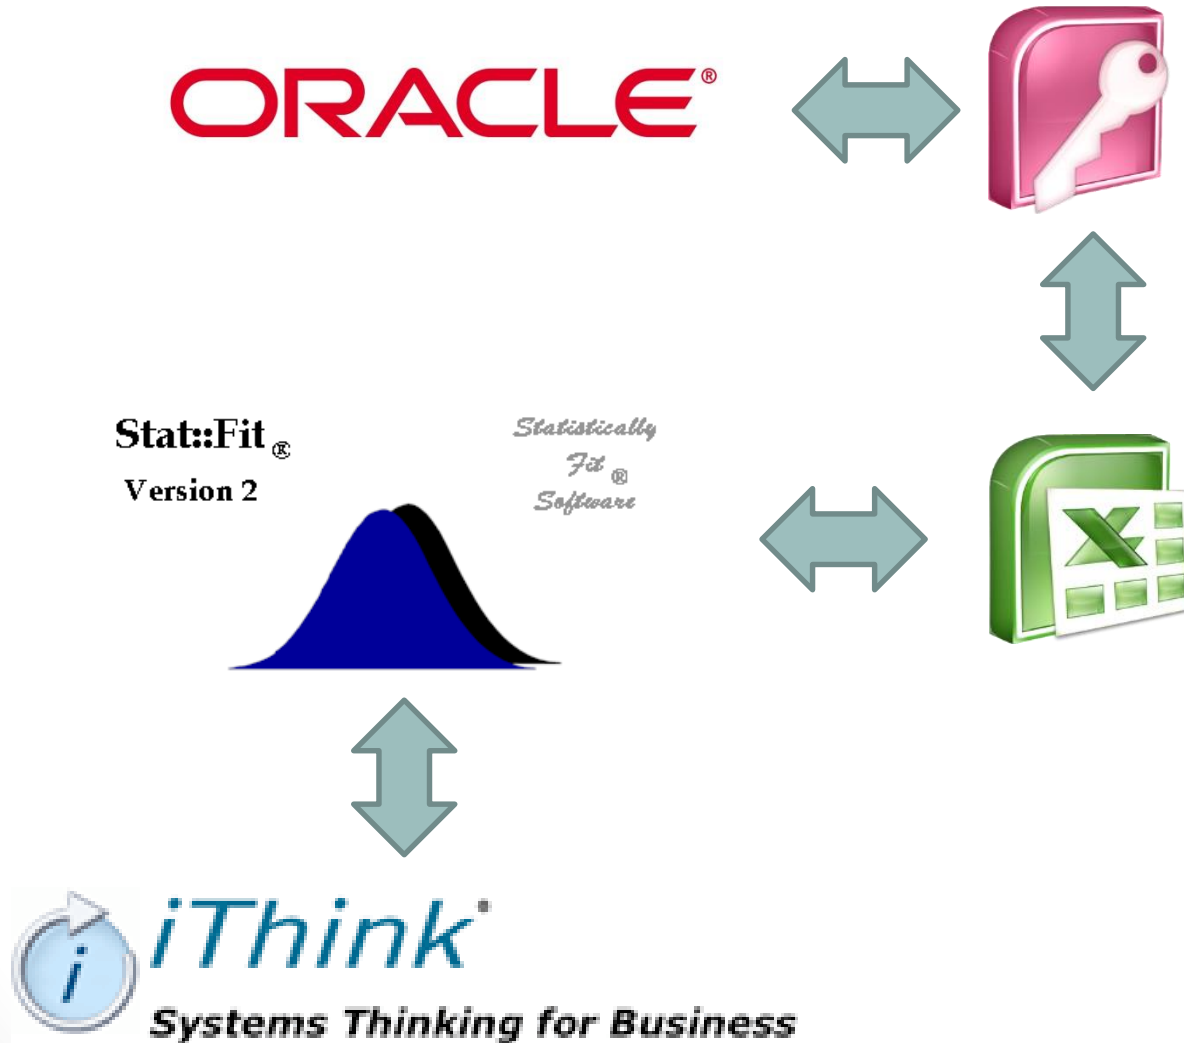

we seek to test the **hypothesis which considers dynamic with variable demand**, allocating appropriate levels of workers and workstations in the services;

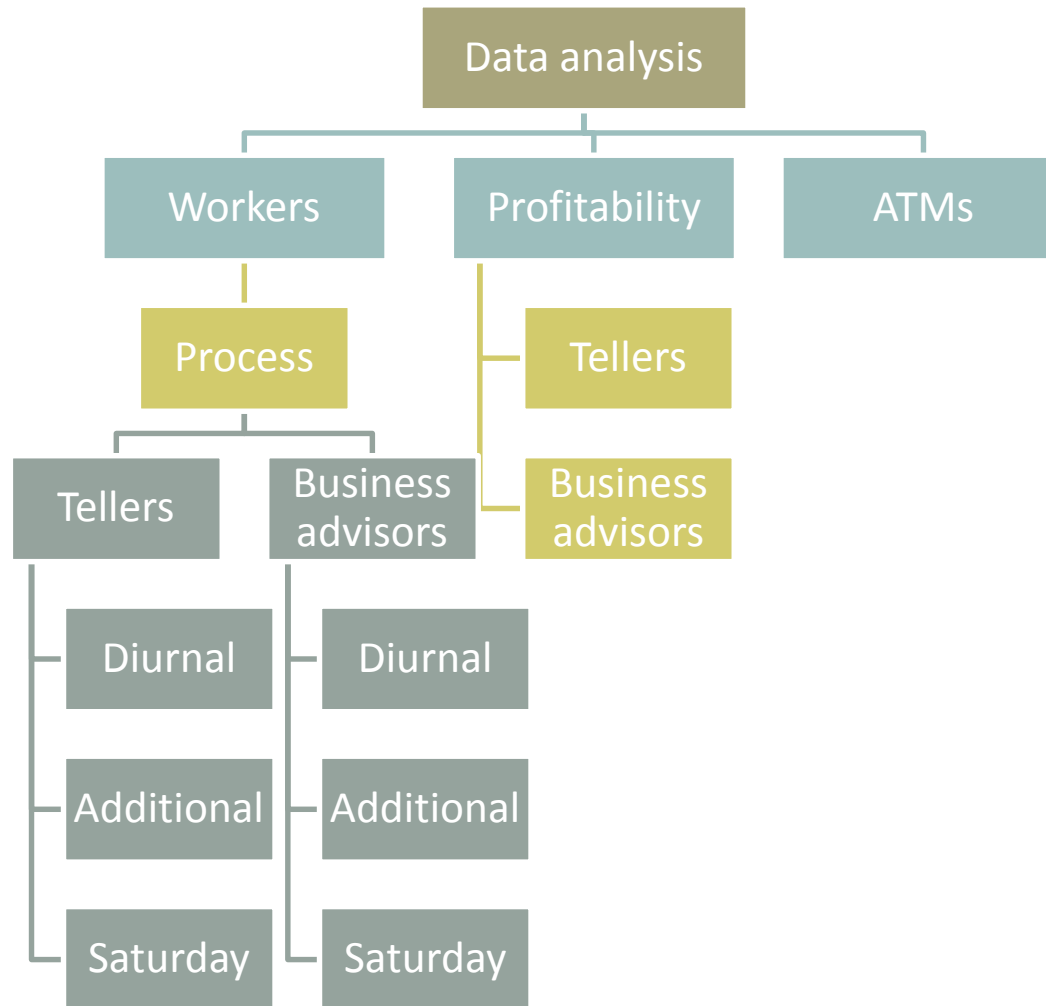

it achieves a **maximum use of the resources capacity** in the system.

Methodology

Methodology

Software

Model parameters

Workstations installed, number of workers and ATMs (initial)

Position	Shift	Locations installed	Current workers	ATMs
Tellers	Diurnal	265	253	120
	Additional		88	
	Saturday		103	
Business advisors	Diurnal	283	248	
	Additional		102	
	Saturday		81	

Available time in hours per month (workers and ATMs)

Type	Shift	Hours / Day	Supplements (%) – Provisioning (hrs)	Days / Month	Available time (Hours / Month)
Workers	Diurnal	6.45	0.11	20	114.72
	Additional	4.37		20	77.80
	Saturday	4.94		4	17.58
ATMs	All day	12.00	0.45	30	346.50

Delays and time review

Type	Setting	Delays (Month)	Time review (Month)
Workers	Hiring	2	3
	Dismissal	1	3
ATMs	Assembly	2	3
	Disassembly	1	3

Capacity analysis

- **Necessary Capacity (Cn_{ijk}):** number of hours demanded for the process i , in the shift j and the month k , equal to transactional demand in hours per process and shift per month (d_{ijk}), results of the input of variables.
- **Available capacity (Cd_{ijk}):** number of hours available according to the time available for the process i , in the shift j , by the month k and the number of workers allocated.
- **Discrepancy Capacity (DS_{ijk}):** difference between the Available Capacity (Cd_{ijk}) and the Necessary Capacity (Cn_{ijk}) or transactional demand (d_{ijk}).

- **Available time in** hours for the process i , in the shift j , by the month k (Td_{ijk})

$$Td_{ijk} = h_j \times (1 - S) \quad (1)$$

Where:

- h_j : number of working hours in the shift j .
- S : Percentage of supplements established by the ILO (International Labour Organization).

- **Available capacity** for the process i , in the shift j , by the month k (Cd_{ijk}):

$$Cd_{ijk} = Td_{ijk} \times dm \times F_{ijk} \quad (2)$$

Where:

- dm : days worked for the month.
- F_{ijk} : workers allocated process i , in the shift j , by the month k .

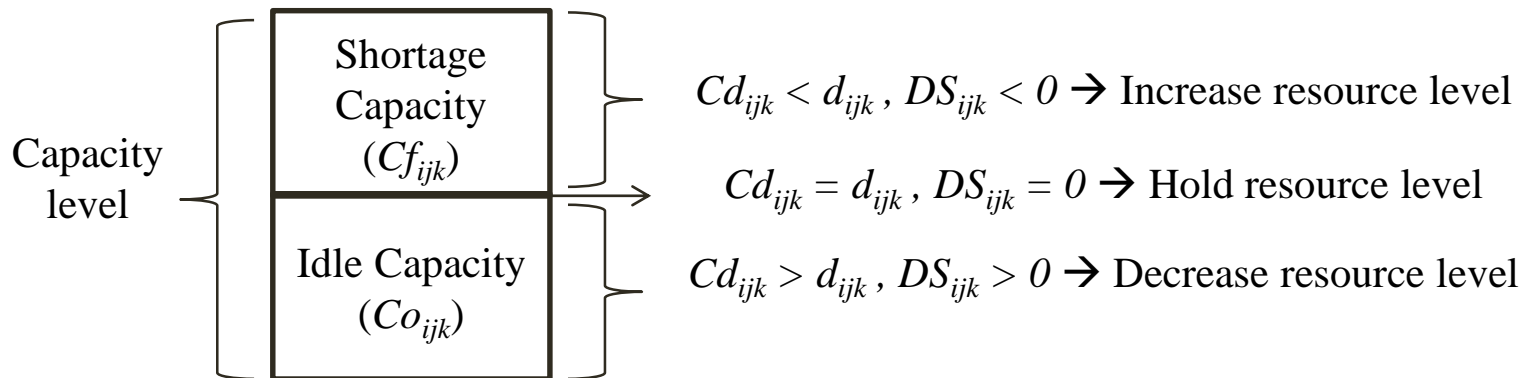

- **Shortage Capacity (Cf_{ijk}):** percentage of shortage capacity given in the case that transactional demand (d_{ijk}) exceeds the available capacity (Cd_{ijk}).

$$Cf_{ijk} = \begin{cases} \left(\frac{d_{ijk} - Cd_{ijk}}{Cd_{ijk}} \right) \times 100, & Cd_{ijk} < d_{ijk} \\ 0, & \text{otherwise} \end{cases} \quad (3)$$

- **Idle Capacity (Co_{ijk}):** percentage of shortage capacity given in the case that the available capacity (Cd_{ijk}) exceeds the transactional demand (d_{ijk}).

$$Co_{ijk} = \begin{cases} \left(\frac{Cd_{ijk} - d_{ijk}}{Cd_{ijk}} \right) \times 100, & Cd_{ijk} > d_{ijk} \\ 0, & \text{otherwise} \end{cases} \quad (4)$$

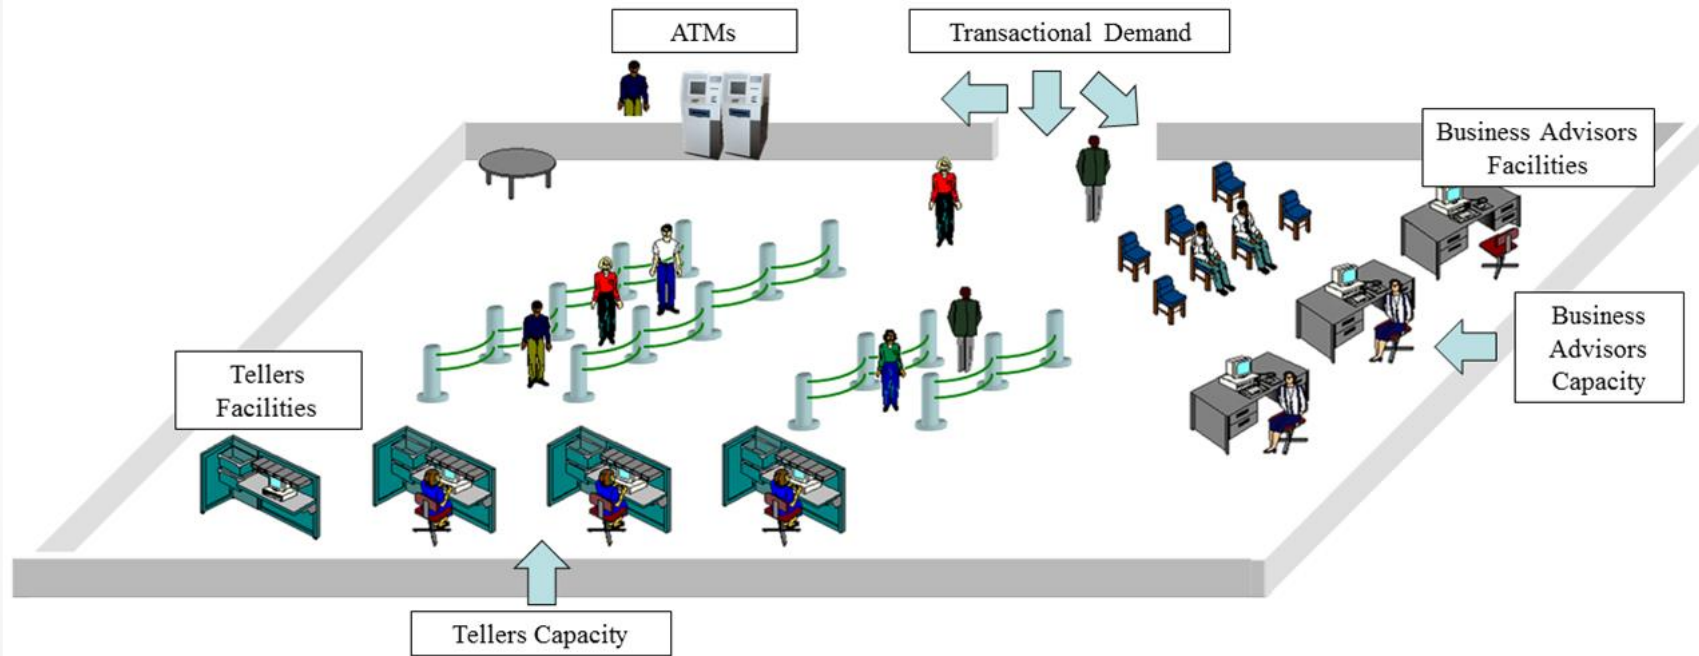

- Graphical analysis of the capabilities and allocation.

Conclusions

Conclusions

- In the last twenty years the **service industry has exponentially increased** its trade balance in billions of dollars
- The models applied to the study of the capabilities **not fully considering the components included in this research**,
 - specifically analyzing the behavior of workers allocated per processes (tellers and business advisers) and shift (diurnal, additional and Saturday),
- Using generators with random variables identified, it was possible to simulate the behavior of a planning horizon longer (60 months),
 - which affected the **fluctuating levels of resource allocation** generated by the model,
 - considering delays and search for the **maximum use of available capacity**.

Conclusions

- Identifying and calculating abilities involved in the modeling, it was possible to compare the behavior of the model, which means finding the **best configuration in resource allocation**,
 - aims to maximize the use of available capacity, reducing the other hand percentages of missing capacity and idle capacity.
- Under the proposed scheme can detect staffing requirements, job requirements and **installation of ATMs**,
- The model is proposed for the analysis of operational capabilities in service companies that **include human resources and facilities**

Future work

Future work

- *Future work on the model developed, will focus on the study of the effect on employment generation:*
- increased electronic transactions,
- analyzing requirements for new skills of the workforce,
- the effect on salaries,
- customer service requirements and facilities for the service and,
- a profitability extended model.

¡Thank you very much!
