AnyLogic is the only simulation software which supports all business modeling methods. In addition to system dynamics modeling, featured at the conference, our software also supports agent-based and discrete event modeling. AnyLogic's graphical interface, tools, and library objects allow you to quickly model diverse areas such as manufacturing and logistics, business processes, human resources, and consumer and patient behavior without being a programmer. We work with thousands of users worldwide including multinational commercial and governmental organizations, and universities.

In 2015 we released AnyLogic 7.3, which included the Fluid library – a powerful tool for simulating models, dealing with liquids. We added a lot of training and case videos on our website, including ones from Anylogic Conference-2015, to provide you with the opportunity to learn best practices of AnyLogic instruments. To cover any questions, concerning user-experience with AnyLogic, we carried out several webinars. You can easily find them on our website.

We are continuously improving our software by adding new features to help you build models of any complexity. As a result, AnyLogic is now capable of imitating sophisticated transport systems with a new Road Traffic Library. At the conference workshop, you will learn how to create such systems, considering traffic laws, cars' interaction and parking peculiarities. Crosswalks, traffic lights, and public transport will make the model more versatile.

Find out more about the workshop time and venue in the conference program. Don't miss the chance to join AnyLogic professionals.
