

Modeling Dynamics of Intimate Partner Violence in South Africa

Sara Peterson | University at Buffalo

2012

2016

in South Africa, three woman are killed
by an intimate partner **every day**

Intimate Partner Violence (IPV)

“any behavior within an intimate relationship that causes physical, psychological or sexual harm to those in the relationship”

-WHO, 2012

Intimate Partner Violence (IPV)

- **Physical violence**
- **Sexual violence**
- **Emotional (psychological) abuse**
- **Controlling behaviors**

IPV is a GLOBAL PHENOMENON

- **All nationalities**
- **All cultures**
- **All religions**
- **All socioeconomic statuses**

Worldwide

30%

South Africa

45%

IPV in South Africa | Consequences

A light gray map of the African continent is centered in the background. The country of South Africa is highlighted in a solid red color, located at the southern tip of the continent.

- **Serious health outcomes**

- Mental health outcomes
- Physical health outcomes
- Linked to South Africa's HIV / AIDS epidemic

- **Persistence despite legislative efforts**

- Despite Domestic Violence Act, rates of IPV have remained stable and high

(Jewkes et. al., 2010)
(Morei, 2014)

Theoretical Frameworks of IPV in South Africa

Historical theoretical divide

FEMINIST THEORIES

- Broad structural factors
- *Apartheid; gender inequalities*

FAMILY VIOLENCE THEORIES

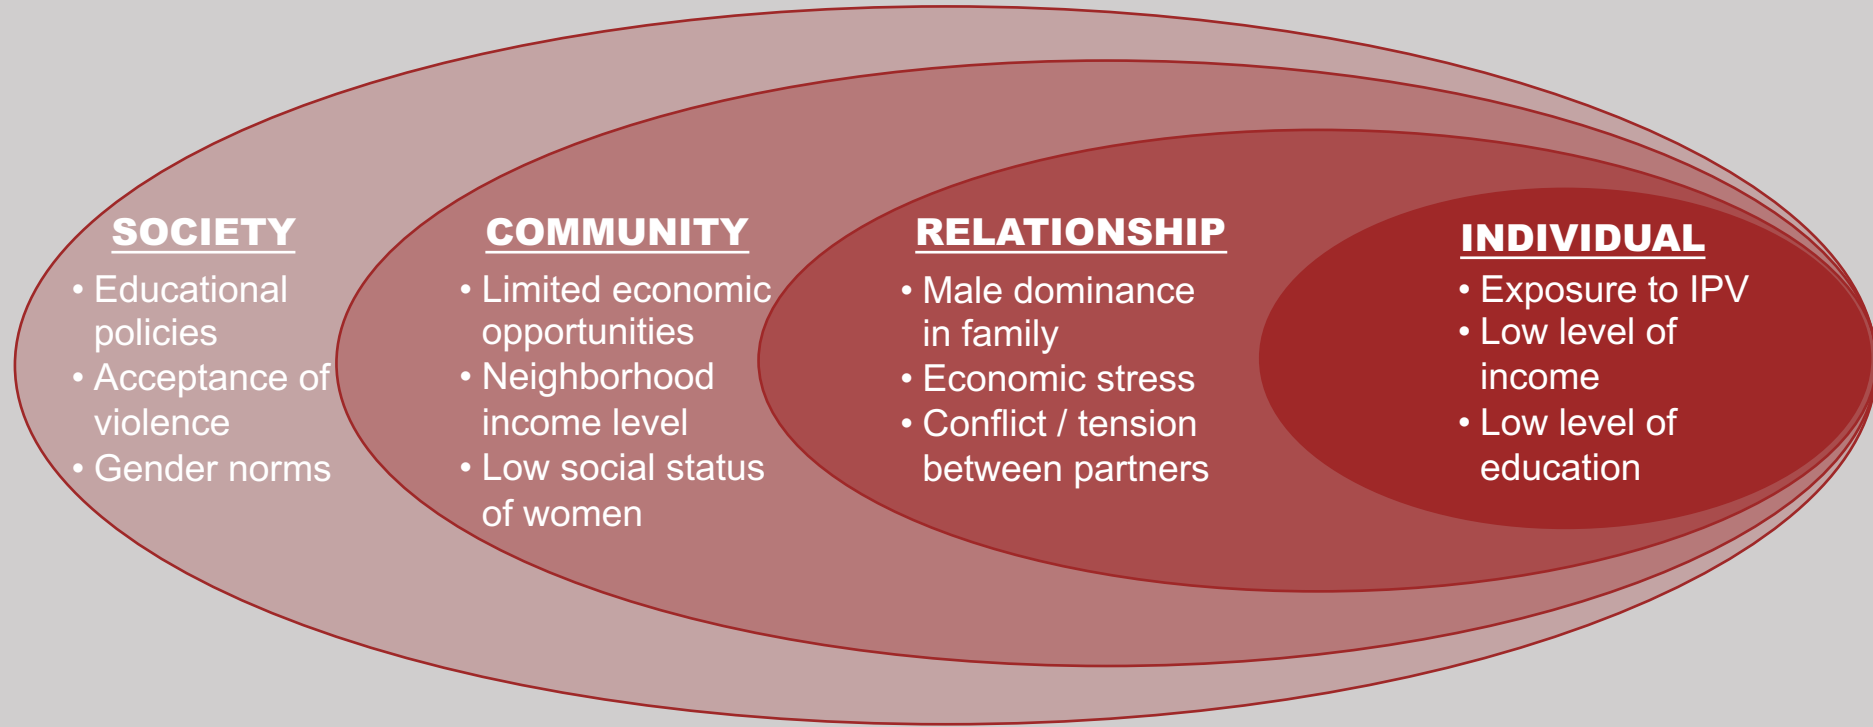

- Immediate surrounding environment
- *Learned social behaviors; scarcity of resources*

Contemporary emphasis on intersectionality

Social Ecological Model of IPV in South Africa

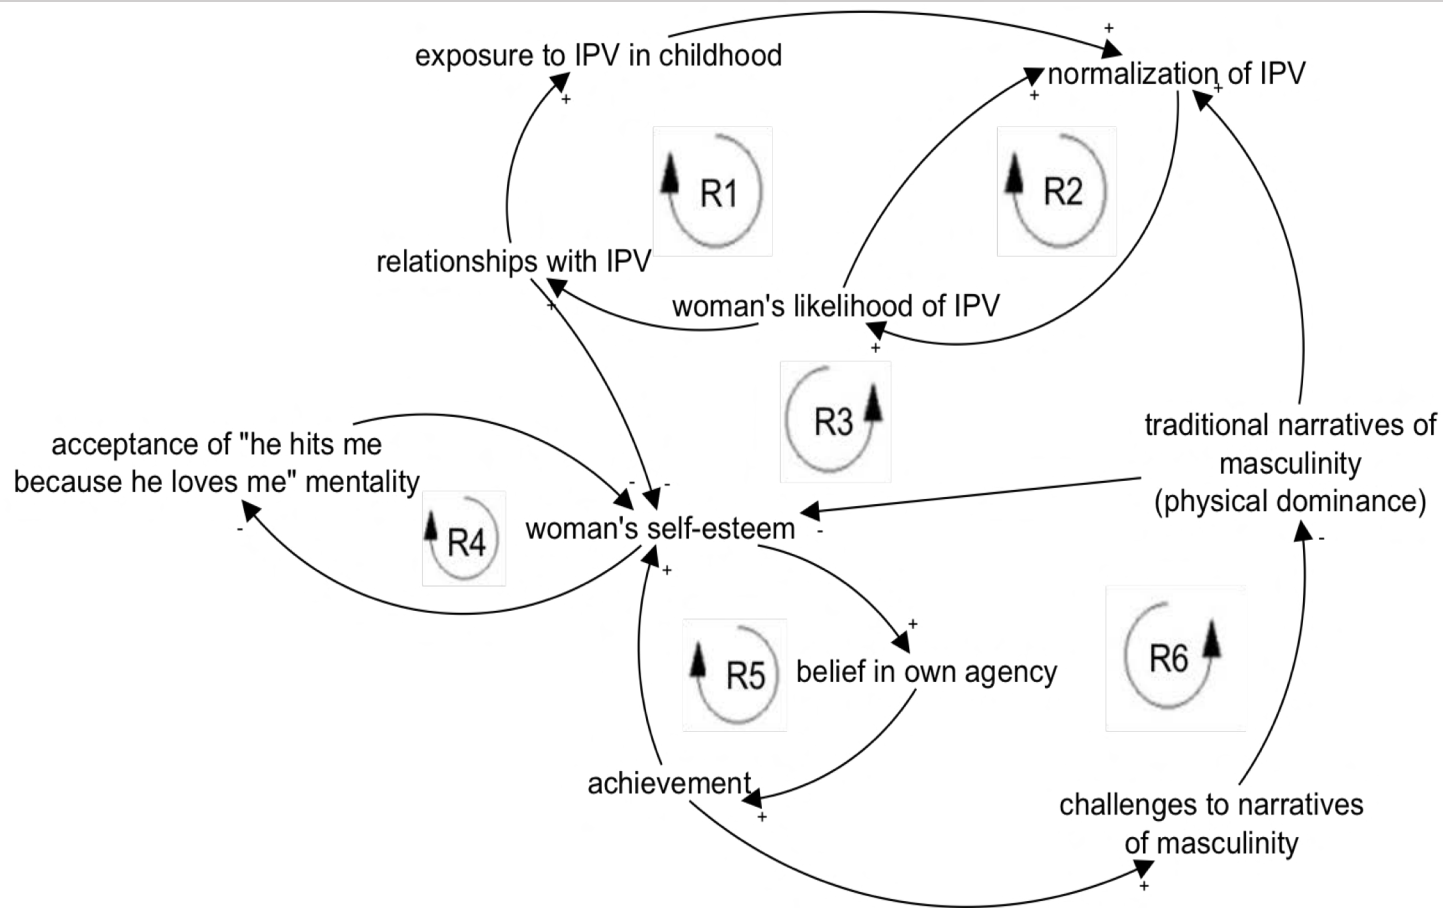

SEM offers combinatorial complexity without dynamic complexity → systems approaches are well suited for systemic problem!

Systems Approaches to IPV | Simple CLD

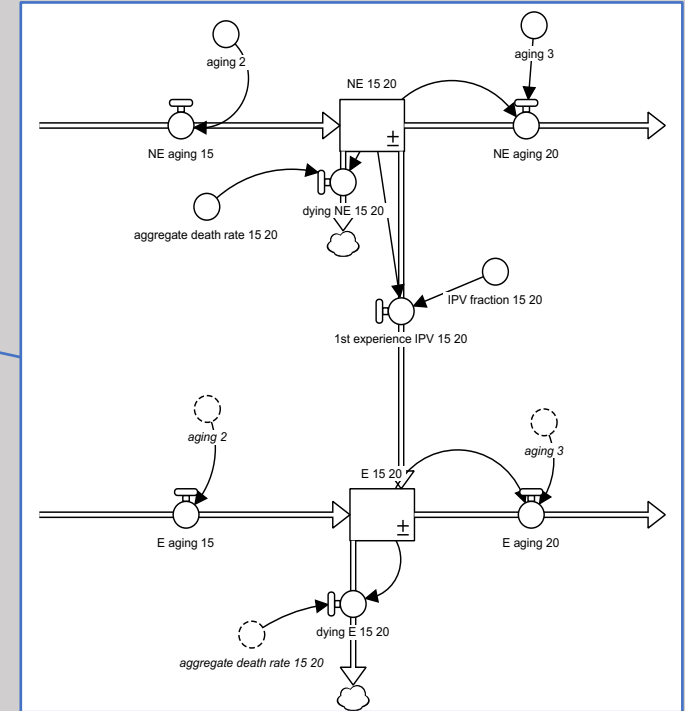

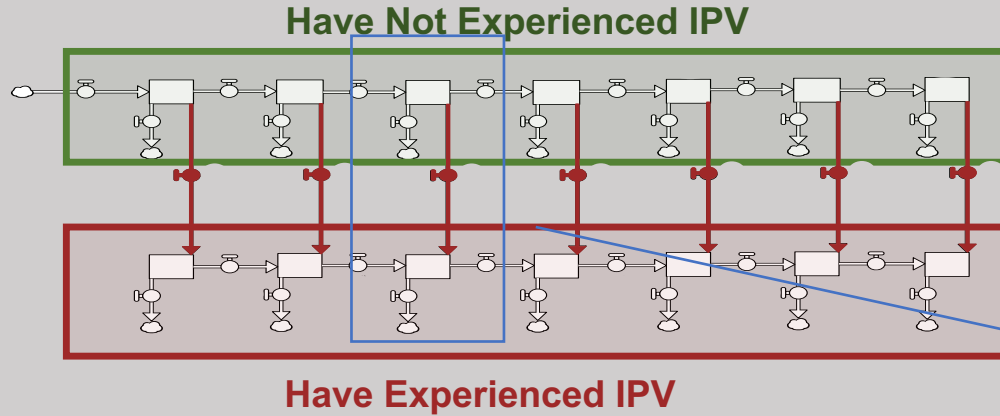

Systems Approaches to IPV | CLD

Systems Approaches | Modeling Exposure to IPV

Aging Chain Model of South African Population

Detail of Single Age Cohort

Assumptions of Model | Population

- Sample population based on demographics of South African population (female)
 - Disaggregated age groups:
 - 0-9**
 - 10-14**
 - 15-19**
 - 20-24**
 - 25-29**
 - 30-49**
 - 50+**

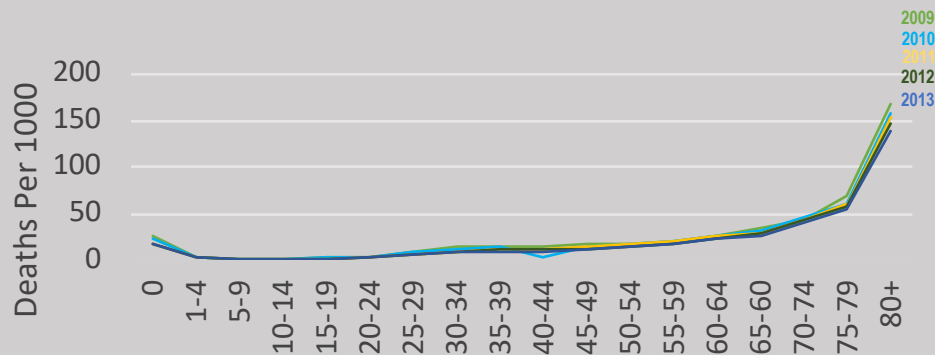

South African Population Pyramid

Assumptions of Model | Age Specific Death Rates

Age group	Deaths per 1000
0-10	6.3333
10-15	1
15-20	1
20-25	3
25-30	5
30-50	9.5
50+	41.14

Age specific death rates (ASDR) by
year of death, 2009 –2013

Assumptions of model | 1st Experience IPV

45% : ESTIMATE OF TOTAL
POPULATION HAVING
EXPERIENCED IPV

Age of **first experience of IPV** is important:

- most women experience IPV by age 25
- **42%** of South African females 13-23 reported experiencing dating violence
(WHO, 2012)
- by age 16, 70% of South African girls view violence in relationships as acceptable
(Grassroot Soccer, n.d.)

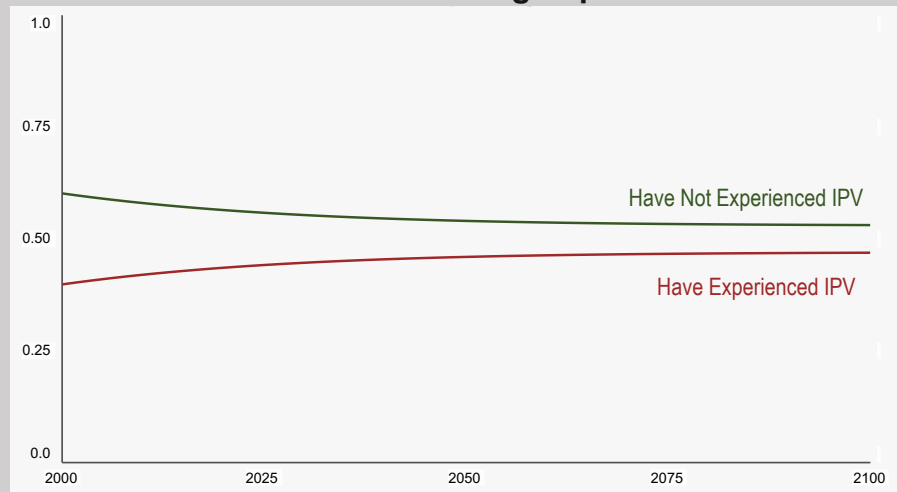

Steady State Results | Birth rate = 0.1458

(Total Fertility Rate of 2.187 children per woman over 15 years)

Number of Women Having Experienced IPV

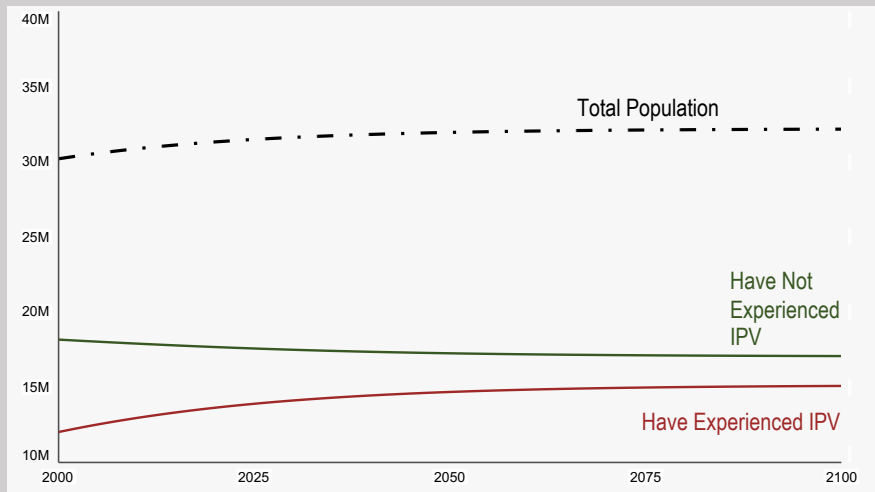

Percent of Women Having Experienced IPV

Growing Population | Steady State vs. Birth rate = 0.25

Number of Women Experienced IPV - Steady State

Number of Women Experienced IPV – Birth rate = .25

South Africa's True Growth | Birth rate = 0.1606

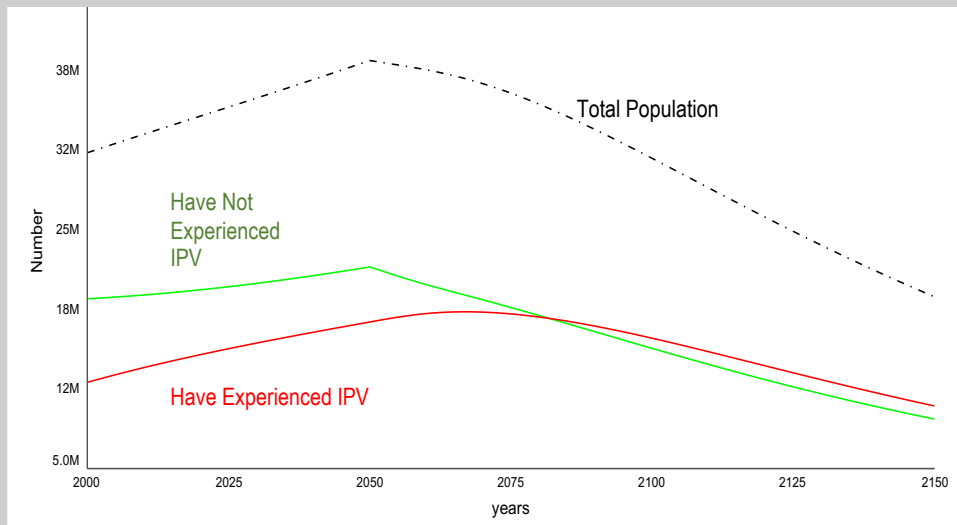

Number of Women Experienced IPV – True Growth Rate

South Africa's true growth rate yields **constant 43%** of total population having experienced IPV

Declining Birth Rates| Step Test: decrease of 0.05 in 2050

Number of Women Experienced IPV:
Step test decrease of 0.05 in 2050

Percent of Women Experienced IPV:
Step test decrease of 0.05 in 2050

Declining Birth Rates | Step Test: decrease of 0.02 in 2020 & 2050

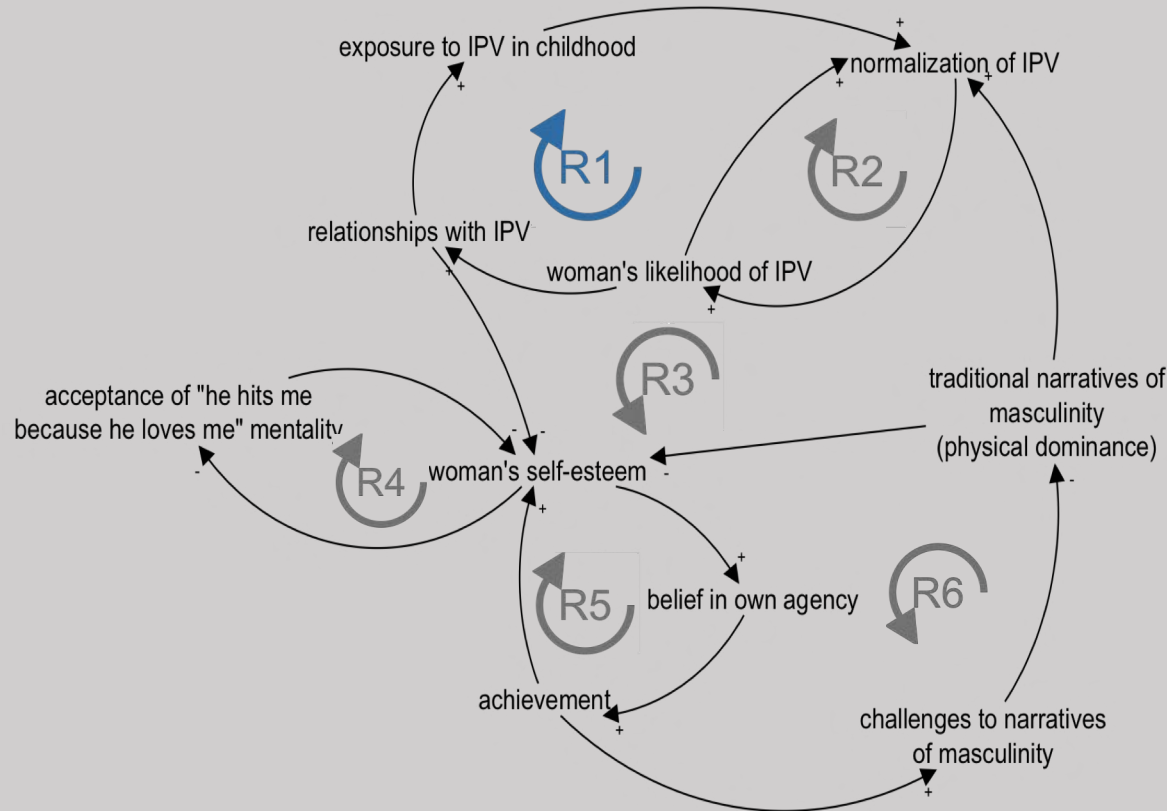

Number of Women Experienced IPV:
Step test decrease of 0.02 in 2020 & 2050

Percent of Women Experienced IPV:
Step test decrease of 0.02 in 2020 & 2050

Systems as a Framework for Understanding IPV

Preliminary model explores first loop of dynamic hypothesis

Insight suggests importance of adopting dynamic approach to a pervasive, sustained public health issue

Systems as a Framework for Understanding IPV⁺
